Subject Index to Volume 6

A

Abductive inference processes, 191–202
Adaptive fuzzy control, 575–582
AI in, activated sludge process for water industry, 241–248
  adjusting integral and derivative terms of a PID controller, 145–152
  air to water cooling system, 219–230
  CAD/CAM in mechanical engineering, 409–423
  cellular telecommunication systems, 249–256
  computer network topology design, 465–472
  control of, paper and pulp processes, 91–103, 357–380
    mining processes, 91–103
    chemical processes, 91–103, 399–407, 575–582
  design of, man-machine systems, 295–305
    circulating fluidized bed boilers, 457–464
  electronic engineering, 437–446
  fault diagnosis in, chemical plants, 191–202,
    coal-fired power plants, 203–218
    computer integrated manufacturing, 21–28
    particle accelerator control systems, 317–331
  fish processing, 165–178
  forest products manufacturing 559–564
  high-order filter synthesis 533–547
  petrochemical industry, 333–343
  software engineering, 29–37
Analytic hierarchy process, 399–407
Attribution matrix, 57–64
Automatic CAD/CAM interface, 409–423
Automatic train control systems, 153–164

B

Bayesian belief networks, 191–202
Boilers, circulating fluidized bed, 457–464
Bond graph modelling, 231–240
Book reviews, 77–78, 279–281, 387–388, 485–488, 593–596
BOXES methodology applied to continuous systems, 145–152

C

Case-based reasoning, 29–37
Causes—symptoms diagram, 333–343
Centrifugal fans, formalization of significant factors, 425–435
Cerebellar Model Articulation Controller compared to backpropagation neural net, 105–115
Chaos, 49–56
Clustering of, patterns, 565–573
  distances between centres, 565–573
Coal mines, roof feature detection, 565–573
Collision avoidance, 3–19
Component compatibility in CAD systems, 219–230
Computer aided control system design, 231–240
Computer control, 499–506
Conflict reasoning for indoor air quality control, 131–144
Contract net models, 399–407
Cooperating expert systems, 317–331

D

Decentralized cooperative systems, 399–407
Decision support systems, 381–386
  for activated sludge process, 241–248

Decision trees formed from single-layer neural nets, 479–484
Distributed AI, 317–331, 399–407
Dynamic evaluation (of a situation), 399–407

E
Energy conservation, 131–144
Expert control systems, guaranteed response time, 499–506
reliability in, 499–506
Expert systems, combined with neural nets, 123–130, 165–178
compared to belief networks, 191–202
cooperating, 317–331
for automatic feature recognition, 409–423
for designing man-machine interface, 295–305
for failure diagnosis in PCBs, 447–456
for fault diagnosis, 21–28, 191–202
for high-order filter synthesis, 533–547
for preliminary design of CFB boilers, 457–464
for gate array selection, 519–531
for transducer selection, 73–75
in real-time control, 499–506
integrated use of, 131–144
review of applications in electronic engineering, 437–446
tools for development of, 507–518
Exothermic chemical reactions, fuzzy control of, 575–582

F
Fault detection and isolation, analytically redundant approach, 203–218
Fault diagnosis, based on functional tests, 447–456
hybrid models, 21–28
in hardware/software configurations, 29–37
in particle accelerator control systems, 317–331
in printer circuits, 345–356
Fault dictionaries, 447–456
Feature learning, unsupervised, 565–573
Feature detection, 565–573
Feature recognition, for protrusions and depressions, 409–423
from 2D drawings, 409–423
Flexible automation in food processing, 165–178
Fluid catalytic cracker unit, 191–202
Find-path problem, 3–19
Fourier transformations, two-dimensional, 473–478
Fractal analysis, applied to fault-trees, 49–56
Fractal dimensions, 49–56
Free-path planning, 3–19
Frege-type graph languages, 65–71
Fuzzy control, multiobjective, optimal, 153–164
in fish processing, 165–178
of exothermic chemical reactions, 575–582
Fuzzy controllers, adaptive, 575–582
for laser tracking systems, 117–122
comparison with full-state proportional controllers, 117–122
Fuzzy-logic-based optimization, 39–47
Fuzzy modelling, 39–47, 257–264
Fuzzy relational equations, 39–47

G
Genetic algorithms, for altering membership functions, 575–582
for minimizing conflicts in equations, 39–47

H
Hessian matrix approximation, 549–557
Heuristic matching rules, 447–456
Heuristic search by perturbations to initial state, 465–472
Hierarchical control structures, 91–103, 165–178
Horizontal-vertical projection, 473–478

I
Image processing in food processing, 165–178
Indoor air quality control, 131–144
Inductive learning, 257–264, 465–472
Inference processes, 191–202, 295–305
Integration of, heuristic and model-based reasoning, 345–356
knowledge-base techniques and hard algorithms, 91–103
pre-existing expert systems, 317–331, 357–380
Intelligent interfaces to, process operator, 295–305
SQL-based databases, 307–316
Intelligent operation support systems, 131–144, 357–380
Interpreters, for natural-language processing, 307–316

K
Kalman filters, 203–218
Knowledge acquisition, advisor for, 507–518
cellular telecommunication systems, 249–256
gate array selection, 519–531
remote interviews for, 507–518
Knowledge-based, automation, for energy conservation, 131–144
of fish processing, 165–178
centrifugal fan blade design, 425–435
circuit and system design, 437–446
control in food processing, 165–178
debugger for hardware/software configurations, 29–37
design of circulating fluidized bed boiler, 457–464
fault detection in coal-fired power plant, 203–218
instrumentation diagnosis, 437–446
mechanical spring selection, 583–591
monitoring of petrochemical processes, 333–343
real-time predictive process control, 91–103
robot control, 123–130
techniques, integrated with hard algorithms, 91–103
Knowledge granularity and fractal dimensions, 49–56
Knowledge graphs, 507–518
Knowledge integration environments, 131–144
Knowledge representation, by belief networks, 191–202
by experience tables, 457–464
by frames, 583–591
by object-oriented methods, 583–591
for database user interfaces, 307–316
for man–machine systems, 295–305
for problem processing, 381–386
for process control, 91–103
fractal analysis of, 49–56
qualitative, 333–343, 357–380
textual, logic based, 65–71
through component constraints, 219–230
validation of, 219–230

L
Learning by examination and review, 145–152

Learning, fault diagnosis algorithm, 21–28
quasi-Newtonian algorithm, 549–557
Logic-programming, 65–71

M
Machine learning in the fault tree, 447–456
Machine vision, applied in food processing, 165–178
Man-machine systems, 295–305
Modelling, fuzzy-logic-based, 39–47
of continuous manufacturing operations, 559–564
Motion planning, 3–19
Multi-agent systems, 317–331
Multi-layer perceptions, 265–278

N
Natural language, formal coding of, 65–71
processing units, 307–316
NC machining programs, 409–423
Neural nets, backpropagation and counterpropagation in 559–564
fast training algorithms for, 549–557
in, coal mines, 565–573,
robot control, 105–115, 123–130
speech classification, 549–557
manufacturing process modelling, 559–564
minimization of processing elements in, 265–278
two-layer, feedforward, 549–557
tree of single-layer nets, 479–484
Non-linear classification boundaries, 479–484

O
Object recognition, 3-D, 57–64
Occluded polyhedral objects, 57–64
Occlusion graphs, 57–64
Optimization, fuzzy-logic-based, 39–47

P
Parameter extraction from circuit schematics, 519–531
Parser, for natural-language processing, 307–316
Partition, of complex processes, 153–164
of input space into clusters, 479–484
Pattern recognition, 479–484
Petroleum industry, dynamic behaviour analysis in, 333–343
Pipeless plant for chemical batch processing, 399–407
Power plants, coal-fired, condensate feedwater subsystems, 203–218
cooling circuits (experimental), 295–305
Probability theory, 191–202
Process planning, 409–423
Pulp quality control, 39–47
Pulping processes, sulphite mill, 357–380

Q
Qualitative modelling, 49–56, 231–240, 333–343
reasoning, 357–380

R
Reading system, letter-driven, 473–478
Real-time expert systems, comparison of, 499–506
Reasoning, model based, 333–343, 345–356
heuristic, 345–356

Recognition of text characters, 473–478
Recovery planning in activated sludge process, 241–248
Reference fuzzy sets, 257–264
Region, adjacency graphs, 57–64
    splitting, 57–64
Reliability and real-time expert systems, 499–506
Robot control, 105–115, 123–130
Robots, 2-D polygonal, 3–19
Robot trajectories, 3–19

S
Soft automation of industrial processes, 87–90
State transition model for activated sludge process, 241–248
Structural controllability analysis, 231–240
Supervised learning, 123–130
Supervisory control, 499–506
Symbolic reasoning, combined with quantitative analysis, 203–218
Symbolic screening, applied to fault-tree 49–56
System failure and recovery, 191–202
Systems with imprecise and conflicting equations, 39–47

T
Topological design of computer networks, 465–472
Trajectory tracking with neural nets, 105–115
Transducer (temperature, flow, pressure) selection, 73–75

V
Validation of a knowledge base, 219–230
